**PREDECTION:**

Based on the test result that the patient underwent, it has been determined that they are 86.89% likely to have anemia.
The test used various factors, such as Age, Sex, RBC, PCV, MCV, MCH, MCHC, RDW, TLC, PLT/mm3, HGB,
among others, to arrive at this conclusion. It is important to note that while the test is highly accurate, it is not infallible,
and additional tests and consultations with medical professionals may be required to confirm the diagnosis. Treatment
and management of anemia may involve dietary changes, iron supplementation, and addressing the underlying causes.
Regular follow-ups with healthcare providers are recommended for proper monitoring and care.
